ABOUT THE COVER

Tumor antigen–targeting mAbs, such as Herceptin, are critical weapons in the cancer 
therapeutic arsenal, yet they cross the blood–brain barrier (BBB) poorly and their success 
treating brain tumors is limited. By conjugating an anti-HER2 mAb with a peptide that utilizes 
receptor-mediated transcytosis across the BBB, a brain-penetrant mAb, ANG4043, was 
created. ANG4043’s retention of tumor-targeting properties was demonstrated in HER2- 
positive BT-474 breast carcinoma cells. Colocalization of the control anti-HER2 mAb and the 
HER2 antigen is shown in yellow on the cell surface. For details, see article by Regina and colleagues on page 129.
