Supplementary Figure 1: Effect of sunitinib on metastatic Renca-luc tumors, orthotopic injection, neoadjuvant setting.

Renca-luc cells were injected under the renal capsule (i.k.) in Balb/c mice. On day 5 tumor take was assessed by bioluminescence (BLI) and animals were randomized by photoncount (PC) to treatment with either vehicle (10/group) or sunitinib (10/group, 30 mg/kg) for 12 days. Animals were killed 24h after the last dose of sunitinib (day 19, interim), and kidney with tumor and lung were removed. (A) Kidney tumor weight (***p<0.001). (B) Total number of metastases per lung.
