## ABOUT THE COVER

TRAIL is a potent inducer of apoptosis through activation of death receptors expressed on tumor cells. To improve the therapeutic activity of TRAIL, a novel tetravalent, bifunctional fusion protein was generated composed of single-chain Fv for targeted delivery (shown in blue), the IgE heavy chain domain 2 (EHD2) as covalently linked homodimerization module (shown in green), and a single-chain derivative of TRAIL as effector moiety (shown in red). Potent antitumoral effects were demonstrated for this scFv-EHD2-scTRAIL fusion protein *in vitro* and *in vivo*, further establishing the advantages of combining tumor targeting with dimeric presentation of scTRAIL. For details, see article by Seifert and colleagues on page 101.
