

**Suppl. Fig. 4. TSR-033 shows little to no binding to C1q by ELISA relative to a human IgG1 reference standard.** A C1q ELISA was employed to evaluate binding of TSR-033, a human IgG1 positive control and two unrelated human IgG4 antibodies to recombinant human C1q (10 µg/mL) as described previously (Idusogie et al. *J Immunol* **2000**;164(8):4178-84). Four parameter non-linear regression analysis was performed for each antibody titration and Emax for each antibody is indicated. TSR-033 bound with an Emax that is 11.6% of the positive control material.
